activation of the complement system gives rise to a number of molecular species which can  
interact with host derived cells and regulate their function this interaction is mediated through  
distinct cell surface complement receptors and receptor engagement produces biologic  
responses which can either modulate host defense reactions or enhance inflammation  
although the first complement receptor was recognized more than 30 years ago 80j detailed  
biochemical information concerning the receptors has only recently become available  
currently eight distinct complement receptors are recognized five receptors cr1 cr2 cr3 c3a  
receptor and c3e receptor react with various regions on c3 while the other receptors display  
specificity for clq c5a or factor h this chapter focusses on the chemistry of the various ligands  
and receptors and discusses the biologic activities which arise as a result of receptor ligand  
interaction ii ciq receptor a the ligand clq is the recognition molecule of the classical  
complement pathway reviewed in 20 130 in serum it is part of a calcium dependent penta  
molecular complex containing one molecule of clq and two molecules each of the pro  
enzymes clr and cis during classical pathway activation the macromolecular complex  
becomes associated with the activator through the clq subcomponent bound clq undergoes a  
conformational change and induces the proteolytic autoactivation of clr which in turn effects  
the proteolytic activation of cis this process is controlled by the cl inhibitor clinh which binds  
irreversibly to activated clr and cis and inhibits their enzymatic activities
